```
// bounce1

float ay = 0.2;           // y acceleration (gravity)
float sx;                 // x position
float sy;                 // y position
float vx;                 // x velocity
float vy;                 // y velocity

void setup() {
    size(500, 500);
    fill(255, 0, 0);
    smooth();
    ellipseMode(CENTER);

    sx = random(0.0, width);
    sy = random(0.0, 10.0);
    vx = random(-3.0, 3.0);
    vy = random(0.0, 5.0);
}

void draw() {
    background(255);

    // Move ball
    sx += vx;
    sy += vy;
    vy += ay;

    // Bounce off walls and floor
    if (sx <= 10.0 || sx >= (width-10.0)) {
        vx = -vx;
    }

    if (sy >= (height-10.0) && vy > 0.0) {
        vy = -0.9*vy;
    }

    // Draw ball
    ellipse(sx, sy, 20, 20);
}
```

```
// bounce3
int nBalls = 200;

float ay = 0.2;      // y acceleration (gravity)
float[] sx = new float[nBalls];    // x position
float[] sy = new float[nBalls];    // y position
float[] vx = new float[nBalls];    // x velocity
float[] vy = new float[nBalls];    // y velocity

void setup() {
    size(500, 500);
    fill(255, 0, 0);
    smooth();
    ellipseMode(CENTER);

    for (int i=0; i<nBalls; i++) {
        sx[i] = random(0.0, width);
        sy[i] = random(0.0, 10.0);
        vx[i] = random(-3.0, 3.0);
        vy[i] = random(0.0, 5.0);
    }
}

void draw() {
    background(255);

    for (int i=0; i<nBalls; i++) {
        // Move ball
        sx[i] += vx[i];
        sy[i] += vy[i];
        vy[i] += ay;

        // Bounce off walls and floor
        if (sx[i] <= 10.0 || sx[i] >= (width-10.0))
        {
            vx[i] = -vx[i];
        }

        if (sy[i] >= (height-10.0) && vy[i] > 0.0)
        {
            vy[i] = -0.9*vy[i];
        }

        // Draw ball
        ellipse(sx[i], sy[i], 20, 20);
    }
}
```

bounce1 vs. bounce3

```
// bounce1
```

```
float ay = 0.2;           // y acceleration
float sx;                 // x position
float sy;                 // y position
float vx;                 // x velocity
float vy;                 // y velocity
```

```
void setup() {
  size(500, 500);
  fill(255, 0, 0);
  smooth();
  ellipseMode(CENTER);
```

```
  sx = random(0.0, width);
  sy = random(0.0, 10.0);
  vx = random(-3.0, 3.0);
  vy = random(0.0, 5.0);
```

```
}
```

```
// bounce3
```

```
int nBalls = 200;
```

```
float ay = 0.2;
float[] sx = new float[nBalls];
float[] sy = new float[nBalls];
float[] vx = new float[nBalls];
float[] vy = new float[nBalls];
```

```
void setup() {
  size(500, 500);
  fill(255, 0, 0);
  smooth();
  ellipseMode(CENTER);
```

```
for (int i=0; i<nBalls; i++) {
  sx[i] = random(0.0, width);
  sy[i] = random(0.0, 10.0);
  vx[i] = random(-3.0, 3.0);
  vy[i] = random(0.0, 5.0);
}
```

```
}
```

Our four arrays might look like this...

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
sx	41	68	49	3	24	5	2	38	53	72	58	11	68	82	68	28	8	5	29	42	11
sy	32	73	81	61	32	68	37	4	18	19	5	98	75	08	.6	49	23	58	65	68	63
vx	0.46	0.85	0.99	0.25	0.61	0.78	0.74	0.2	0.85	0.7	0.66	0.39	0.99	0.15	0.11	0.85	0.18	0.15	0.64	0.61	0.82
vy	0.93	0.67	0.1	0.67	0.22	0.05	0.37	0.89	0.22	0.86	0.96	0.93	0.7	0.73	0.27	0.98	0.04	0.36	0.66	0.15	0.37

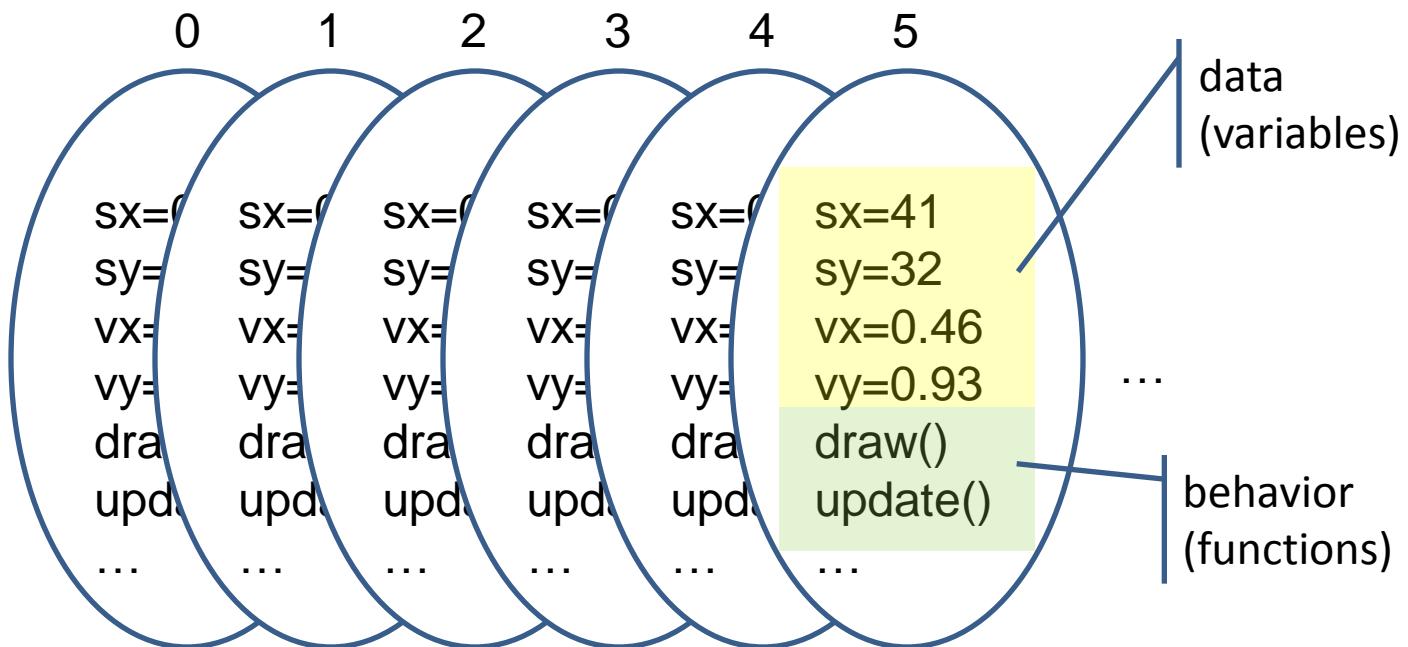

Our four arrays might look like this...

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
sx	41	68	49	3	24	5	2	38	53	72	58	11	68	82	68	28	8	5	29	42	11

vy	0.93	0.67	0.1	0.67	0.22	0.05	0.37	0.89	0.22	0.86	0.96	0.93	0.7	0.73	0.27	0.98	0.04	0.36	0.66	0.15	0.37

But we think of them like this ... all data items for the same ball

Stored like this ...

For each ball ...

- ... we want the **data** (variables) called **fields**,
- ... as well as the **behavior** (functions) called **methods**,
- ... to be grouped together into a single software unit with which we can work

OBJECTS

Defining Your Own Object with Classes

- Classes are blueprints or prototypes for new objects
- Classes encapsulate all field and method declarations
 - ... which are repeated for each new object created
- Using a class to create a new object is called instantiating an object
 - ... creating a new object instance of the class
- Classes often model real-world items

Defining Your Own Objects with Classes

```
// Defining a new class of object

class MyObjectName {

    // All field variable declarations go here;

    // Define a special function-like statement called
    // the class's Constructor.
    // It's name is same as object class name,
    // with no return value.

    MyObjectName( optional arguments ) {

        // Perform all initialization here

    }

    // Declare all method functions here.
}
```

```
// A Ball Class
class Ball {
    // Fields
    float ay = 0.2;      // y acceleration (gravity)
    float sx;           // x position
    float sy;           // y position
    float vx;           // x velocity
    float vy;           // y velocity

    // Constructor
    Ball() {
        sx = random(0.0, width);
        sy = random(0.0, 10.0);
        vx = random(-3.0, 3.0);
        vy = random(0.0, 5.0);
    }

    // Methods
    void update() {
        // Move ball
        sx += vx;
        sy += vy;
        vy += ay;

        // Bounce off walls and floor
        if (sx <= 10.0 || sx >= (width-10.0)) {
            vx = -vx;
        }
        if (sy >= (height-10.0) && vy > 0.0) {
            vy = -0.9*vy;
        }
    }

    void draw() {
        ellipse(sx, sy, 20, 20);
    }
}
```

Compare the parts
of a class to the
parts of a sketch

Creating New Objects with Classes

- To create a new instance of an object, use the ***new*** keyword and call the object Constructor

```
MyObjectName ob = new MyObjectName(42);
```

```
Ball b = new Ball();
```

```
String s = new String("Blah"); ←  
String s = "Blah"; ← Same result
```

Use the Ball Class

Treat in a manner very similar to a primitive data type.

```
// bounce4
Ball[] balls = new Ball[20]; ← Declare an array of Balls.

void setup() {
    size(500, 500);
    fill(255, 0, 0);
    smooth();
    ellipseMode(CENTER);

    // Create all new Ball objects
    for (int i = 0; i < balls.length; i++) {
        balls[i] = new Ball(); ← New objects are created with
    }                                the new keyword.
}

void draw() {
    background(255);

    for (int i = 0; i < balls.length; i++) {
        balls[i].update(); ← Methods of objects stored in
        balls[i].draw();   the array are accessed using
    }                      dot-notation.
}
```

Warning

- The ‘new’ keyword is used both for sizing arrays and for ‘instantiating’ new objects

```
Ball[] balls = new Ball[20]; // Size an array
```

```
balls[0] = new Ball(); // Create a new object
```

An Expanded Ball Class

```
// A Ball Class
class Ball {
    // Fields
    float ay = 0.2;          // y acceleration (gravity)
    float sx;                // x position
    float sy;                // y position
    float vx;                // x velocity
    float vy;                // y velocity
    float diameter;          // Ball diameter
    color clr;               // Ball color

    // Constructor
    Ball( float d, color c ) {
        sx = random(0.0, width);
        sy = random(0.0, 10.0);
        vx = random(-3.0, 3.0);
        vy = random(0.0, 5.0);
        diameter = d;           // Save the diameter provide
        clr = c;                // Save the color
    }

    // etc.

}
```

```
Tree myMaple; // Variable defined as type Tree  
  
void setup() {  
    myMaple = new Tree("maple", 30.3); // Create  
}
```

fields

```
class Tree {  
    String name;  
    float height;
```

constructor

```
Tree( String tname, float theight) {  
    name = tname;  
    height = theight;  
}
```

method

```
void draw() {  
    fill( 0, 255, 0 );  
    ellipse(random(width),random(height),50,50);  
}  
}
```

Creating Objects

1. Declare a variable with the class as type
2. Invoke the constructor using the new keyword and assign to variable

```
Tree myMaple;           // Variable defined as type Tree  
  
myMaple = new Tree("maple", 30.3);    // Create and assign  
  
// -----  
  
// Two steps combined in one  
Tree myMaple = new Tree("maple", 30.3);
```

- Values passed to a constructor must be copied to object fields to "stick" ... why?

Why copy? →

```
class Tree {  
    String name;  
    float height;  
  
    Tree( String tname, float theight) {  
        name = tname;  
        height = theight;  
    }  
  
    void draw() {  
        fill( 0, 255, 0 );  
        ellipse(random(width),random(height),50,50);  
    }  
}
```

Creating Objects

- What is wrong with this?

```
Tree myMaple;           // Variable defined as type Tree  
  
void setup() {  
    Tree myMaple = new Tree("maple", 30.3); // Combined  
}
```

Using Objects

- variable :: fields (field is a variable inside an object)
- function :: method (method is a function inside an object)
- An variable that stores an object is used to scope access to the fields and methods of that particular object

Using Objects

```
Tree myMaple;  
  
void setup() {  
    myMaple = new Tree("maple", 30.3);  
}
```

```
void draw() {  
    myMaple.draw();  
}
```

```
class Tree {  
    String name;  
    float height;  
  
    Tree( String tname, float theight) {  
        name = tname;  
        height = theight;  
    }  
  
    void draw() {  
        fill( 0, 255, 0 );  
        rect( 10, 10, 50, 300 );  
    }  
}
```

Using Objects

What is
wrong with
this?

```
Tree myMaple;  
  
void setup() {  
    myMaple = new Tree("maple", 30.3);  
}
```

```
void draw() {  
    Tree.draw();  
}
```

```
class Tree {  
    String name;  
    float height;  
  
    Tree( String tname, float theight) {  
        name = tname;  
        height = theight;  
    }  
  
    void draw() {  
        fill( 0, 255, 0 );  
        rect( 10, 10, 50, 300 );  
    }  
}
```

Arrays - Creating

- A structure that can hold multiple items of a common data type
- Arrays can hold any data type, including objects
- The data type to be held by an array must be declared as part of the array declaration
- Arrays are themselves a kind of type, which is made by adding brackets to the type that the array can hold

Arrays – Creating and Init'ng (3 Steps)

1. Declare an array variable
 - The variable is NOT an array
2. Create an array and assign it to the variable
 - Use the new keyword and size
 - The array is filled with default values
 - int <- 0
 - float <- 0.0
 - boolean <- false;
 - any object including String <- null
3. Fill the array with items of appropriate type

```
Tree[] trees;
```

Step 1

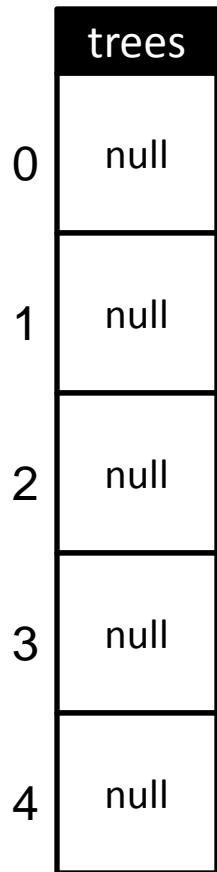

trees

← No array.

Only a variable that can hold an array.

```
Tree[] trees;  
trees = new Tree[5];
```

Step 2

← An empty array. null Tree objects.

```
Tree[] trees;  
trees = new Tree[5];  
trees[0] = new Tree("maple", 20.0);  
trees[1] = new Tree("oak", 203.4);
```

Step 3

trees	
0	name="maple"; height=20.0;
1	name="oak"; height=203.4;
2	null
3	null
4	null

← An array with two Tree objects.

```
Tree[] trees;  
trees = new Tree[5];  
for (int i=0; i<5; i++) {  
    trees[i] = new Tree( "maple"+i, random(200.0) );  
}
```

Step 3

trees	
0	name="maple0"; height=12.5;
1	name="maple1"; height=105.3;
2	name="maple2"; height=198.6;
3	name="maple3"; height=4.08;
4	name="maple4"; height=99.9;

← An array with five Tree objects.

```
Tree[] trees;

void setup() {
    trees = new Tree[3];
    trees[0] = new Tree("maple", 30.3);
    trees[1] = new Tree("oak", 130.3);
    trees[2] = new Tree("spruce", 230.3);
}

void draw() {
    for (int i=0; i<trees.length; i++ ) {
        trees[i].draw();
    }
}

class Tree {
    String name;
    float height;

    Tree( String tname, float theight) {
        name = tname;
        height = theight;
    }

    void draw() {
        fill( 0, 255, 0 );
        ellipse( random(width), random(height), 50, 50 );
    }
}
```

Comparing Declarations and Initializers

int	i;
int	j = 3;
float	fac = 0.1;
float[]	Xs;
float[]	Ys = new float[10];
float[]	Zs = new float[] {1.2, 2.3, 3.4};
String	s1 = "abc";
String	s2 = new String("abc");
String[]	s3 = new String[50];
String[]	s4 = new String[] {"moe", "larry", "curly"};
Ball	b = new Ball();
Ball[]	bs = new Ball[200];
