# CS206

## Analysis of Algorithms

---

# Sorted Linked Lists

---

```
public class SortedDLL<T extends Comparable<T>> extends  
DoubleLinkedList<T> {  
  
    @Override  
    public void addLast(T t) {  
    }  
  
    @Override  
    public void addFirst(T t) {  
    }  
  
    @SuppressWarnings("unchecked")  
    public void addSorted(Comparable<T> t) {  
        // lots of thought here  
    }  
}
```

---

# Running Time

---

- The run time of a program depends on
  - efficiency of the algorithm/implementation
  - size of input
  - what else?
- The running time typically grows with input size
- How do you measure running time?
  - CPU usage?
  - Reliability?

---

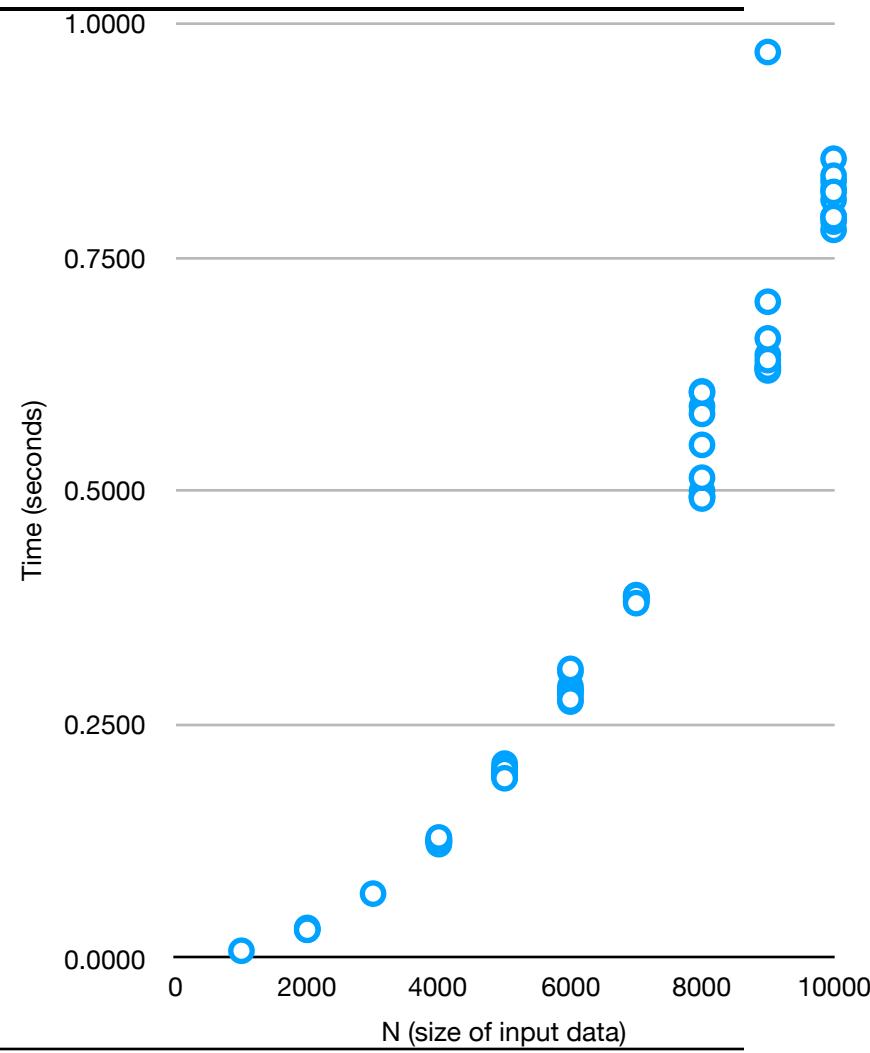

# Timing Code

---

```
public class Timer {  
    private static final int REPS = 10; // number of trials  
    private static final int NANOS_SEC = 1000000000; // nanosec per sec  
  
    public double doSomething(int[] data) {  
        double k = 0;  
        for (long i = 0; i < data.length; i++) {  
            for (long j = 0; j < data.length; j++) {  
                k += Math.sqrt(i * j);  
            }  
        }  
        return k;  
    }  
  
    public static void main(String[] args) {  
        Timer timer = new Timer();  
        long data[] = new long[REPS];  
        for (int j = 1000; j < 10001; j = j + 1000) {  
            for (int i = 0; i < REPS; i++) {  
                long start = System.nanoTime();  
                timer.doSomething(new int[j]);  
                long finish = System.nanoTime();  
                data[i] = (finish - start);  
                System.out.println(String.format("%d %.4f", j, (double) (finish - start) /  
NANOS_SEC));  
            }  
        }  
    }  
}
```

# Experimental Studies

- Write a program implementing the algorithm
- Run it with different input sizes and compositions
- Record times and plot results

---

# Limitation of Experiments

---

- You have to implement the algorithm
- You have to generate inputs that represent all cases
- Comparing two algorithms requires exact same hardware and software environments
  - Even then timing is hard
    - multiprocessing
    - file i/o

---

# Theoretical Analysis

---

- Use a high-level description of algorithm
  - pseudo-code
- Running time as a function input size,  $n$
- Ignore other details of the input
- Independent of the hardware/software environment

---

# Primitive Operations

---

- Basic computations
  - \* / + -
- Comparisons
  - ==, >, <
- Setting
  - $x = y$
- Assumed to take constant time
  - exact constant is not important
  - Because constant is not important, can do more than just this list

---

# Example

## Time required to compute an average

---

```
public double calcA(long[] data)
{
    double res = 0;
    for (int i=0; i<data.length; i++)
    {
        res = res+data[i];
    }
    return res/data.length;
}

public static calcB(long[] data) {
    double res = 0;
    long pd = 0;
    for (int i=0; i<data.length; i++) {
        long datum=data[i];
        if (pd<datum) {
            res = res+datum;
        }
        pd=datum;
    }
    return res/data.length;
}
```

How many operations? (In terms of the length of data)

---

# Estimate Running Time

---

- `calcB` executes a total of  $7N+1$  primitive operations in the worst case,  $5N+1$  in the best case.
- Let  $a$  be the fastest primitive operation time,  $b$  be the slowest primitive operation time
- Let  $T(n)$  denote the worst-case time of `calcB`. Then  $a(5n + 1) \leq T(n) \leq b(7n + 1)$
- $T(n)$  is bounded by two functions
  - both are linear in terms of  $n$

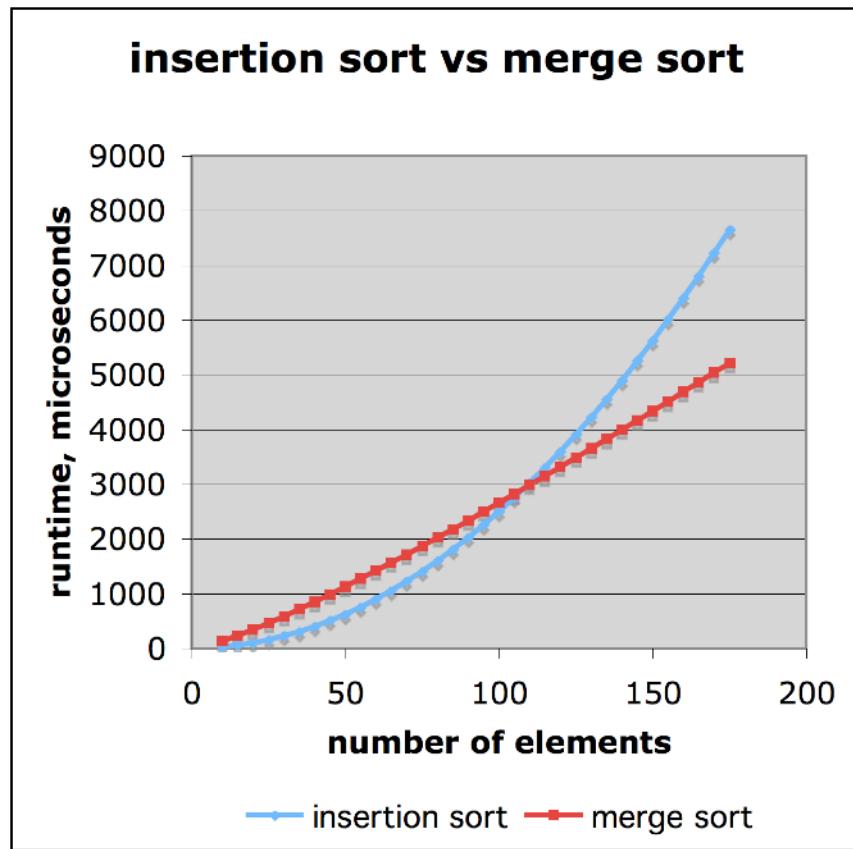

---

# Growth Rate of Running Time

---

- Changing the hardware/ software environment
  - Affects  $T(n)$  by a constant factor, but
  - Does not alter the growth rate of  $T(n)$
- The linear growth rate of the running time  $T(n)$  is an intrinsic property of algorithm calcB (and calcA)

# Comparison of Two Algorithms

- insertion sort:  $n^2/4$
- merge sort:  $2nlgn$
- suppose  $n=10^8$ 
  - insertion sort:  
 $10^8 \times 10^8 / 4 = 2.5 \times 10^{15}$
  - merge sort:  
 $10^8 \times 26 \times 2 = 5.2 \times 10^9$
  - or merge sort can be expected to be about  $10^6$  times faster
  - so if merge sort takes 10 seconds then insertion sort takes about 100 days

---

# Asymptotic Notation

---

- Provides a way to simplify analysis
- Allows us to ignore less important elements
  - constant factors
- Focus on the largest growth of  $n$ 
  - Focus on the dominant term

---

# How do these functions grow?

---

- $f_1(x) = 43n^2 \log^4 n + 12n^3 \log n + 52n \log n$
- $f_2(x) = 15n^2 + 7n \log^3 n$
- $f_3(x) = 3n + 4 \log_5 n + 91n^2$
- $f_4(x) = 13 \cdot 3^{2n+9} + 4n^9$

---

# Big O

---

- Constant factors are ignored
- Upper bound on time
- Goal is to have an easily understood summary of algorithm speed
  - not implementation speed

---

# Sublinear Algorithms

---

- $O(1)$ 
  - runtime does not depend on input
- $O(\lg_2 n)$ 
  - algorithm constantly halves input

---

# Linear Time Algorithms: $O(n)$

---

- The algorithm's running time is at most a constant factor times the input size
- Process the input in a single pass spending constant time on each item
  - max, min, sum, average, linear search
- Any single loop

---

 $O(n \log n)$  time

---

Frequent running time in cases when algorithms involve:

- Sorting
  - only the “good” algorithms
    - e.g. quicksort, merge sort, ...

---

# Quadratic Time: $O(n^2)$

---

- Nested loops, double loops
  - The doSomething **algorithm**
- Processing all pairs of elements
- The less-good sorting algorithms
  - e.g., insertion sort

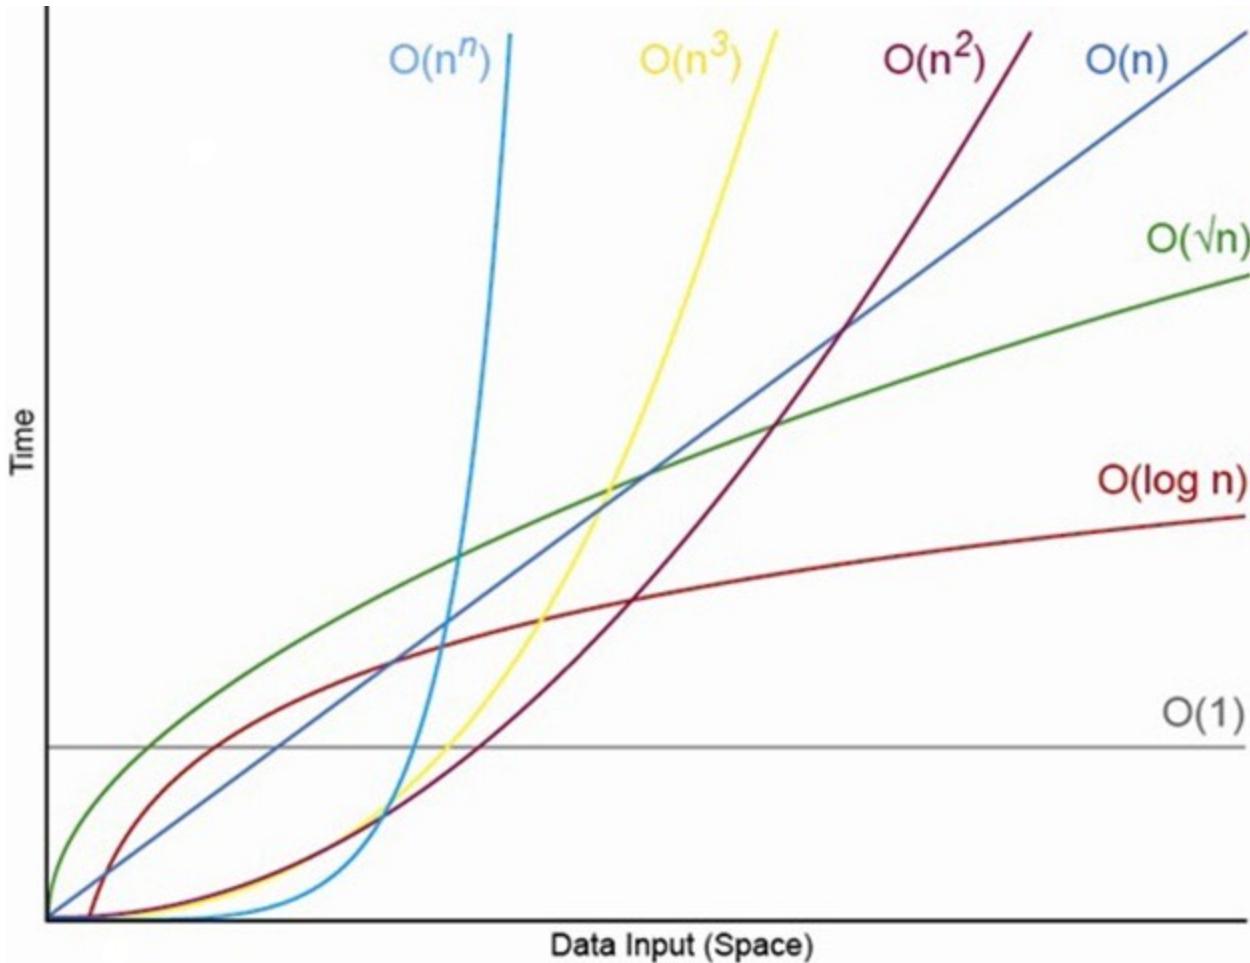

---

# Slow Times

---

- polynomial time:  $O(n^k)$ 
  - All subsets of  $n$  elements of size  $k$
- exponential time:  $O(2^n)$ 
  - All subsets of  $n$  elements (power set)
- factorial time:  $O(n!)$ 
  - All permutations of  $n$  elements

# Timing

---

# Writing code that runs in $O(x)$ time

---

```
public interface SpeedyAlgorithms {  
    void orderOne(int[] data);  
    void orderLogN(int[] data);  
    void orderN(int[] data);  
    void orderNSquared(int[] data);  
    void orderNCubed(int[] data);  
    void orderNFactorial(int[] data);  
}
```
