Question 1.

(a). Sort the following list using bubble sort. Each iteration, circle the two elements which are compared.

```java
int[] L = {20, 14, 7, 8};
```

To make the answer for this question clearer, assume we are using the following $O(N^2)$ algorithm for bubble sort (no optimizations).

```java
void bubbleSort(int[] L) {
    for (int n = 0; n < L.length; n++) {
        for (int j = 1; j < L.length; j++) {
            if (L[j-1] > L[j]) {
                swap(j-1, j, L);
            }
        }
    }
}
```

| 20 | 14 | 7 | 8 |
(b). Sort the following list using selection sort. Each iteration, circle the two elements which are swapped.

```java
int[] L = {20, 14, 7, 8};

To make the answer for this question clearer, assume we are using the following $O(N^2)$ algorithm for selection sort (no optimizations).

```java
void selectionSort(int[] L) {
    for (int startIdx = 0; startIdx < L.length; startIdx++) {
        int minIdx = startIdx;
        for (int j = startIdx; j < L.length; j++) {
            if (L[j] < L[minIdx]) {
                minIdx = j;
            }
        }
        swap(startIdx, minIdx, L);
    }
}
```

20  14  7  8
